

CLAIMS

1. A method for automatic dose control of a liquid treatment chemical during a liquid treatment process within a treatment system, the system having an influent flow and an effluent flow, the method comprising:

a. measuring the liquid flow rate through the treatment system and generating a liquid flow rate signal from the measurement;

b. measuring the concentration of a chemical within the treatment system and generating a chemical concentration signal from the measurement;

c. transmitting the signal generated from step (a) and the signal generated from step (b) to a chemical dosing controller;

d. automatically calculating the dosage of a chemical from signals supplied to the chemical dosing controller;

e. transmitting an output signal from the chemical dosing controller to a chemical feeding system, the output signal based on dosage calculated in step (d);

f. releasing the chemical from step d into influent flow in response to output signal of step (e); and

g. repeating steps (a)-(f) continuously during the liquid treatment process.

2. The method of claim 1 wherein the of liquid flow rate is measured in the influent flow of the system.

3. The method of claim 1 wherein the liquid flow rate is measured in the effluent flow of the system.

4. The method of claim 1 wherein the liquid flow rate is adjusted by a multiplier.

5. The method of claim 1 wherein the concentration of the chemical in step (b) is measured in the influent flow of the system.

1 6. The method of claim 1 wherein the concentration of the chemical in  
2 step (b) is measured in the effluent flow of the system.

1 7. The method of claim 1 wherein the concentration of the chemical in  
2 step (b) is measured both in the effluent flow and in the influent flow of the  
3 system.

1 3/8. The method of claim 1 wherein the chemical in step (b) is the same  
2 chemical as in step (d).

1 4/8. The method of claim 1 wherein the chemical in step (b) is a different  
2 chemical from the chemical in step (d).

1 5/10. The method of claim 1 wherein the measurement of the liquid flow  
2 rate in step (a) and the concentration of the chemical in step (b) is  
3 performed continuously.

1 6/11. The method of claim 1 wherein the measurement of the liquid flow  
2 rate in step (a) is continuous and the measurement of the concentration of  
3 the chemical in step (b) is performed at intervals within a range of from a  
4 fraction of a second to approximately 15 minute intervals.

1 7/12. The method of claim 1 wherein the liquid of the liquid treatment  
2 process is water and the treatment process is a water treatment process.

Sub #3 13. A method for automatic dose control of nitrate-nitrogen during a  
2 water treatment process within a denitrification treatment system using a  
3 chemical source of organic carbon as the feed chemical, the system having  
4 an influent flow and an effluent flow, the method comprising:

- 5 a. measuring the water flow rate through the treatment system and  
6 generating a water flow rate signal from the measurement;  
7 b. measuring the concentration of nitrate-nitrogen within the influent  
8 flow of the treatment system and generating a chemical concentration  
9 signal from the measurement;

Sub A3  
Method for Automatic Dose Control of Liquid Treatment Chemicals

- 10 c. transmitting the signal generated from step (a) and the signal  
11 generated from step (b) to a chemical dosing controller;  
12 d. automatically adjusting the nitrate/nitrogen signal by at least one  
13 adjustable dose factor;  
14 e. automatically calculating the dosage of the feed chemical from  
15 adjusted signals supplied to chemical dosing controller;  
16 f. transmitting an output signal from the chemical dosing controller to a  
17 chemical feeding system, the output signal based on dosage calculated in  
18 step (e);  
19 g. releasing the feed chemical into the influent flow in response to the  
20 output signal of step (f); and  
21 h. repeating steps (a)-(g) continuously during the denitrification  
22 process.

1 14. The method of claim 13 wherein the feed chemical is selected from  
2 the group consisting of alcohol and volatile fatty acid.

1 15. The method of claim 14 wherein the feed chemical is methanol.

Sub A4 1 16. The method of claim 13 wherein the water flow rate signal of step (c)  
2 is automatically adjusted by a flow pace multiplier.

1 17. The method of claim 13 wherein the concentration of the nitrate-  
2 nitrogen is measured both at the effluent flow and at the influent flow of the  
3 system.

Sub A5 1 18. The method of claim 17 wherein a setpoint for effluent nitrate-  
2 nitrogen is selected, an effluent flow concentration signal is generated from  
3 the measurement of concentration of nitrate-nitrogen in the effluent flow  
4 and the concentration signal is transmitted to the chemical dosing  
5 controller.

1 <sup>13</sup>~~19~~. The method of claim <sup>12</sup>~~18~~ wherein the difference between the effluent  
2 concentration of nitrate-nitrogen and the setpoint is calculated to generate  
3 a control response, the control response is adjusted by one or more  
4 sensitivity factors and the adjusted control response is automatically  
5 incorporated into the calculation for the dosage of the feed chemical.

Sub A6 1 20. The method of claim 19 wherein the dosage is used to generate a  
2 modified output signal which is transmitted from the chemical dosing  
3 controller to the chemical feeding system.

1 <sup>15</sup>~~21~~. The method of claim <sup>14</sup>~~20~~ wherein the modified output signal from the  
2 chemical dosing controller to the chemical feeding system is transmitted  
3 after a reset time.

1 <sup>16</sup>~~22~~. The method of claim <sup>15</sup>~~21~~ wherein the reset time is input manually.

1 <sup>17</sup>~~23~~. The method of claim <sup>15</sup>~~21~~ wherein the reset time is an automatically  
2 calculated variable based on the hydraulic residence time through the  
3 process and the process reaction time.

Sub A7 1 24. The method of claim <sup>18</sup>~~13~~ wherein the nitrate-nitrogen signal is  
2 automatically adjusted by at least one adjustable dose factor.

1 25. A method for automatic dose control of nitrate-nitrogen during a  
2 water treatment process within a denitrification treatment system using a  
3 chemical source of organic carbon as the feed chemical, the system having  
4 an influent flow and an effluent flow, the method comprising:

- 5 a. selecting a setpoint for effluent nitrate-nitrogen;  
6 b. measuring the water flow rate through the treatment system and  
7 generating a water flow rate signal from the measurement;  
8 c. measuring the concentration of nitrate-nitrogen in the effluent flow  
9 and generating a chemical concentration signal from the measurement;

- 10 d. transmitting the signal generated from step (b) and the signal  
11 generated from step (c) to a chemical dosing controller;  
12 e. calculating the difference between the effluent concentration of  
13 nitrate-nitrogen and the setpoint to generate a control response;  
14 f. adjusting the control response by one or more sensitivity factors;  
15 g. automatically calculating the dosage of the feed chemical from the  
16 control response;  
17 h. transmitting output signal from chemical dosing controller to the  
18 chemical feeding system, the output signal based on dosage calculated in  
19 step (g);  
20 i. releasing the feed chemical into influent flow in response to output  
21 signal of step (h); and  
22 j. repeating steps (a)-(i) continuously during the denitrification process.

1 <sup>20</sup>26. The method of claim 25 wherein the concentration of nitrate-nitrogen  
2 is measured in both the influent flow and the effluent flow.

1 <sup>21</sup>27. The method of claim 26 wherein the concentration of the of nitrate-  
2 nitrogen in the influent flow is measured and an influent flow concentration  
3 signal is generated and transmitted to the chemical dosing controller.

Sub A8 1 28. The method of claim 27 wherein the influent flow concentration signal  
2 is adjusted by an adjustable dose factor and the water flow rate signal from  
3 step (d) is adjusted by a flow pace multiplier.

1 29. The method of claim 27 wherein the calculation of an output signal  
2 from the chemical dosing controller to the chemical feeding system is  
3 based on water flow rate, concentration of nitrate-nitrogen in the influent  
4 flow and concentration of nitrate-nitrogen in the effluent flow.

1 30. The method of claim 25 wherein the calculation of succeeding  
2 control responses in step (e) is performed after a reset time.

- 1 <sup>25</sup>31. The method of claim <sup>24</sup>30 wherein the reset time is input manually.
- 1 <sup>24</sup>32. The method of claim <sup>24</sup>30 wherein the reset time is an automatically  
2 calculated variable based on the hydraulic residence time through the  
3 process and the process reaction time.
- 1 <sup>24</sup>33. The method of claim <sup>24</sup>30 wherein a derivative control response is  
2 generated to counteract rapid rates of change towards or away from the  
3 setpoint.
- 1 <sup>24</sup>34. The method of claim <sup>27</sup>33 wherein a derivative control response is  
2 generated by determining a first effluent concentration prior to the reset  
3 time, a second effluent concentration is measured at the reset time,  
4 comparing the first effluent concentration to the second effluent  
5 concentration and adjusting the control response accordingly.
- 1 <sup>29</sup>35. A method for automatic dose control of a liquid treatment chemical  
2 during a treatment process within a liquid treatment system using a feed  
3 chemical, the system having an influent flow and an effluent flow, the  
4 method comprising:  
5 a. selecting a setpoint for a chemical in the effluent flow;  
6 b. measuring the liquid flow rate through the treatment system and  
7 generating a liquid flow rate signal from the measurement;  
8 c. measuring the concentration of the chemical of step (a) in the influent  
9 flow and generating an influent chemical concentration signal from the  
10 measurement;  
11 d. measuring the concentration of the chemical of step (a) in the  
12 effluent flow and generating an effluent chemical concentration signal from  
13 the measurement;  
14 e. transmitting the signal generated from step (b) to a chemical dosing  
15 controller and generating a primary control response;  
16 f. adjusting the primary control response by a flow pace modifier;

- 17 g. transmitting the signal generated from step (c) to a chemical dosing  
18 controller and generating a secondary control response;  
19 h. adjusting the secondary control response by an adjustable dose  
20 factor;  
21 i. transmitting the signal from step (d) to the chemical dosing controller  
22 and calculating the difference between the effluent chemical concentration  
23 and the setpoint to generate a tertiary control response;  
24 j. adjusting the tertiary control response by one or more sensitivity  
25 factors;  
26 k. continuously calculating the dosage of the feed chemical from the  
27 primary control response and secondary control response while  
28 incorporating the tertiary control response from step (f) after a reset period;  
29 l. transmitting an output signal from chemical dosing controller to a  
30 chemical feeding system, the output signal based on dosage calculated in  
31 step (k);  
32 m. releasing a feed chemical into influent flow in response to output  
33 signal of step (l); and  
34 n. repeating steps (a)-(m) continuously during the treatment process.
- 1 <sup>30</sup> 36. The method of claim <sup>29</sup> 35 wherein the chemical in step (a) is the same  
2 chemical as in step (m). <sup>29</sup>
- 1 <sup>31</sup> 37. The method of claim <sup>29</sup> 35 wherein the chemical in step (a) is a different  
2 chemical from the chemical in step (m). <sup>29</sup>
- 1 <sup>32</sup> 38. The method of claim <sup>29</sup> 35 wherein the reset time is input manually. <sup>29</sup>
- 1 <sup>33</sup> 39. The method of claim <sup>29</sup> 35 wherein the reset time is an automatically  
2 calculated variable based on the hydraulic residence time through the  
3 process and the process reaction time.
